New nucleic acids encoding AINTEGUMENTA-like polypeptides useful in improving agronomic, horticultural, and quality traits of plants, such increased size of plant organs. as

Claim 3; Page 130-133; 169pp; English.

The present sequence is the protein sequence of GmANT1, a newly identified AINTECUMENTA-like (ANT-like) polypeptide of soybean. The sequence is predicted from clone CPR67663 (see ABN84480), which was obtained from a soybean sequence database screening using Arabidopsis ANT as query. Also isolated was clone CPR67628 encoding GmANT2 (see ABR9637). GmANT1 and GmANT2 show homology to ANT in 2 N-terminal AP2 DNA binding domains, but have C-terminal sequences that bear little, if any, homology to ANT although they share conserved segments with each other. The invention provides nucleic acids encoding ANT-like polypeptides comprising, in the N-terminal to C-terminal direction, 2 AP2 DNA binding domains followed by an amino acid subsequence selected from those given in ABB79629-35. ANT-like polypeptides have been identified in soybean,

Nucleic acids (see ABB84480-86) encoding the ANT-like polypeptides can be used in the construction of transgenic plants, especially corn, soybean, canola, wheat, cotton, tomato or potato (all claimed) having improved agronomic, horticultural or other quality traits, such as increased size of plant organs. These plants are especially useful for production of ethanol or animal feedstuff
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 663

The present sequence is the protein sequence of GmANT2, a newly condensified AINTEGUMENTA-like (ANT-like) polypeptide of soybean. The sequence is predicted from clone CPR67626 (see ABN84481), which was cobtained from a soybean sequence database screening using Arabidopsis ANT cas query. Also isolated was clone CPR6763 encoding GmANT1 (see CABS79636). GmANT1 and GmANT2 show homology to ANT although they share conserved segments with each other. Chomology to ANT although they share conserved segments with each other. Creaming in the N-terminal to C-terminal direction, 2 AP2 DNA binding comprising, in the N-terminal to C-terminal direction, 2 AP2 DNA binding comprising, in the N-terminal to C-terminal direction, 2 AP2 DNA binding comprising, and amino acid subsequence selected from those given in ABB79629-35. ANT-like polypeptides have been identified in soybean, crice, cotton and corn (see ABB79636-41). Nucleic acids (see ABN84480-86) cencoding the ANT-like polypeptides can be used in the construction of transgenic plants, sepecially corn, soybean, canola, wheat, cotton, cotton content quality traits, such as increased size of plant organs. These constructs are especially useful for production of ethanol or animal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New nucleic acids encoding AINTEGUMENTA-like polypeptides useful in improving agronomic, horticultural, and quality traits of plants, such increased size of plant organs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 19-DEC-2001; 2001WO-US049294

The present sequence is the protein sequence of OSANT1, a newly identified AINTEGUMENTA-like (ANT-like) polypeptide of rice. The sequence was predicted from a cDNA clone (see ABN84482) obtained from panicle RNA by PCR amplification. OSANT1 cDNA was not amplified from root or leaf RNAs, suggesting tissue-specific expression. Initial OSANT1 clones had been identified in a rice database screening using the newly identified soybean ANT-like polypeptide GMANT1 education and rice ANT-like polypeptide, OSANT2 (see ABS79639), was also isolated. OSANT1 polypeptide shares high homology with Arabidopsis ANT, GmANT1 and GMANT2 at the N-

The invention provides nucleic acids encoding ANT-like polypeptides comprising, in the N-terminal to C-terminal direction, 2 AP2 DNA binding domains followed by an amino acid subsequence selected from those given in ABB79629-35. ANT-like polypeptides were identified in soybean, rice, cotton and corn (see ABB79636-41). Nucleic acids (see ABB84480-86) encoding the ANT-like polypeptides can be used in the construction of transgenic plants, especially corn, soybean, canola, wheat, cotton, tomato or potato claimed) having improved agronomic, horticultural or other quality traits, such as increased size of plant organs. These plants are especially useful for production of ethanol or animal feedstuff
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 642

                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is the protein sequence of OsANT2, a newly identified AINTEGUMENTA-like (ANT-like) polypeptide of rice. The sequence of deatabase screening. An additional rice ANT-like polypeptide, OsANT1 (see ABB79638), was also identified. The invention provides nucleic acids cerminal direction, 2 AP2 DNA binding domains followed by an amino acid subsequence selected from those given in ABF79639-35. ANT-like polypeptides were identified in soybean, rice, cotton and corn (see CC polypeptides were identified in soybean, rice, cotton and corn (see CC polypeptides can be used in the construction of transgenic plants, cespecially corn, soybean, canola, wheat, cotton, tomato or potato (all claimed) having improved agronomic, horticultural or other quality craits, such as increased size of plant organs. These plants are construction of transgenic plants are specially useful for production of ethanol or animal feedstuff

Claim 11;

```
The present sequence represents an aintegumenta (ANT) polypeptide. The ANT gene is expressed and functions not only in developing ovules but also in various developing organs. Growth and cell proliferation in plant can be modulated by modulating ANT activity. Modulation of ANT activity is used to alter organ mass, control fertility and enhance asexual reproduction in plants. Increased ANT activity can be used to produce male or female sterile plants. Inhibition of ANT activity can be used to truncate vegetative growth, resulting in early flowering
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Modulating growth and cell proliferation in a plant used to alter organ mass, control fertility and enhance asexual reproduction in plants comprises modulating ANT activity and selecting plants with altered cell

Novel nucleotide fragment encoding polypeptides protein kinase activity, caleosin-like activity, phenotypes in plants such as sunflower, coconut, having receptor-like, useful for altering, soybean, wheat and

rice 011

Page 463-465; 542pp; English.

The present invention describes an isolated nucleotide fragment (I) comprising a nucleic acid sequence (NS) chosen from a NS encoding a polypeptide (PP) having receptor-like protein kinase activity, mitogen activated protein (MAP)-kinase activity, LIP15-like transcription factor activity and CKC-like activity, ATP citrate lyase activity, NNF1-like activity and CKC-like transcription factor activity. Also described: (1) cc complement (II) of (I); (2) a chimeric construct (III) comprising (I) or (II), operably linked to a regulatory sequence; (3) a plant (IV) cc comprising (III) in its genome; (4) seeds (V) obtained from (IV); and (5) cc librained from (IV). (I) or its part can be used in antisense collocation or co-suppression in a transformed plant. (III) is also useful for canola, Brassica, sorghum, sunflower or coconut. (III) is also useful for creating transgenic plants having altered lipid profiles. (I) can also be used as a hybridisation probe. ACC00626 and ABR40591 to ABR40879 represent sequences used in the exemplification of the present

The present sequence represents an aintegumenta (ANT) polypeptide. The ANT gene is expressed and functions not only in developing ovules but also in various developing organs. Growth and cell proliferation in plant can be modulated by modulating ANT activity. Modulation of ANT activity is used to alter organ mass, control fertility and enhance asexual reproduction in plants. Increased ANT activity can be used to produce male or female sterile plants. Inhibition of ANT activity can be used to produce truncate vegetative growth, resulting in early flowering
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            asexual reproduction; early flowering.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              07-JAN-2000; 2000WO-US000465

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                멂
                                                              The present sequence is the protein sequence of GhANT1, a newly identified AINTEGUMENTA.like (ANT-like) polypeptide of cotton. The sequence was predicted from a cDNA clone (see ABN94485) isolated in a cotton DNA database screening. The invention provides nucleic acids encoding ANT-like polypeptides comprising, in N-terminal to C-terminal direction, 2 AP2 DNA binding domains followed by an amino acid subsequence selected from those given in ABB79629-35. ANT-like polypeptides were identified in soybean, rice, cotton and corn (see ABB7963-41). Nucleic acids (see ABN94480-86) encoding the ANT-like polypeptides can be used in the construction of transgenic plants, especially corn, soybean, canola, wheat, cotton, tomato or potato (claimed) having improved agronomic, horticultural or other quality traits, such as increased size of plant organs. These plants are especially useful for production of ethanol or animal feedstuff
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         01-AUG-2002.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ś
                                                                                         멍
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes an isolated nucleotide fragment (I) comprising a nucleic acid sequence (NS) chosen from a NS encoding a CC comprising a nucleic acid sequence (NS) chosen from a NS encoding a CC polypeptide (PP) having receptor-like protein kinase activity, mitogen cactivated protein (MAP)-kinase activity, LIPIS-like transcription factor activity and CKC-like transcription factor activity. Also described: (I) cC camplement (II) of (I); (2) a chimeric construct (III) comprising (I) or CC (III), operably linked to a regulatory sequence; (3) a plant (IV) cC comprising (III) in its genome; (4) seeds (V) obtained from (IV); and (5) CC conjustion or co-suppression in a transformed plant. (III) is useful for C canola, Brassica, sorghum, sunflower or coconut. (III) is useful for C creating transgenic plants surflower or coconut. (III) is also useful for C creating transgenic plants having altered lipid profiles. (I) can also be used as a hybridisation probe. ACC00628 to ACC00668 and ABR40591 to ABR40879 represent sequences used in the exemplification of the present

   The present invention describes an isolated nucleotide fragment (I) comprising a nucleic acid sequence (NS) chosen from a NS encoding a CC comprising a nucleic acid sequence (NS) chosen from a NS encoding a CC polypeptide (PP) having receptor-like protein kinase activity, mitogen activated protein (MAP)-kinase activity, LIF15-like transcription factor activity and CKC-like transcription factor activity. Also described: (1) cC complement (II) of (I); (2) a chimeric construct (III) comprising (I) or CC (II), operably linked to a regulatory sequence; (3) a plant (IV) CC comprising (III) in its genome; (4) seeds (V) obtained from (IV); and (5) cll obtained from (IV). (I) or its part can be used in antisense CC inhibition or co-suppression in a transformed plant. (III) is useful for CC allering the oil phenotype in a plant such as corn, soybean, wheat, rice, CC canola, Brassica, sorghum, sunflower or coconut. (III) is also useful for creating transgenic plants having altered lipid profiles. (I) can also be CC used as a hybridisation probe. ACC00626 to ACC00868 and ABR40591 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Plant; oil trait; oil phenotype; altered lipid profile; receptor-like protein kinase; mitogen activated protein LIP15-like transcription factor caleosin; ATP citrate ly CKC-like transcription factor; antisense inhibition; cotransgenic plant.
                                                                                                                                                                                                                                                                          Novel nucleotide fragment encoding polypeptides having receptor-like protein kinase activity, caleosin-like activity, useful for altering phenotypes in plants such as sunflower, coconut, soybean, wheat and a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 09-JAN-2003

                                                                                              밁
                                                                                                                                                           밁
                                                                                                                                                                                          S
                                                                                                                                                                                                                        밁
                                                                                                                                                                                                                                                    S
                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes an isolated nucleotide fragment (I) comprising a nucleic acid sequence (NS) chosen from a NS encoding a CC comprising a nucleic acid sequence (NS) chosen from a NS encoding a CC polypeptide (PP) having receptor like protein kinase activity, mitogen cativated protein (MAP)-kinase activity, LPIS-like transcription factor activity and CKC-like transcription factor activity and CKC-like transcription factor activity. Also described: (1) cc activity and CKC-like transcription factor activity. Also described: (1) cc complement (II) of (I); (2) a chimeric construct (III) comprising (I) or CC complement (II) in its genome; (4) sequence; (3) a plant (IV); and (5) cc comprising (III) in its genome; (4) seeds (V) obtained from (IV); and (5) cc oil obtained from (V). (I) or its part can be used in antisense confliction or co-suppression in a transformed plant. (III) is useful for CC campla, Brassica, sorghum, sunflower or coconut. (III) is also useful for creating transgenic plants having altered lipid profiles. (I) can also be used as a hybridisation probe. ACC00626 to ACC00868 and ARR40591 to ACC00868 and ARR40591 to constitution of the present sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                       Query Match
